Identify 3–5 tools or templates and explain what each helps participants contribute, decide or navigate

1. Engineering can use the Read-Only exports to explain available command and scheduler records, as well as technical interpretations. The Read-Only exports allow the Engineers to make critical conclusions that help them to explain complex ideas.
2. Analysts can examine source packets to draw conclusions from collections of raw data. Through this, they can navigate through many different details to make recommendations to sponsors, who will examine them to make further decisions.
3. Operations are able to use summaries of recent evidence to inform sponsors. Through this, Operations can make decisions on what information is worth informing sponsors of, and which others would only serve to confuse or mislead.

Write three identity-building questions that help stakeholders explain the knowledge, responsibility, or perspective they bring to the work.

1. What do you expect the proposed project to ultimately accomplish when it is completed?
2. What values or beliefs do you hold that would influence the work that you request and approve?
3. How would you communicate and distribute resources with your fellow stakeholders?
