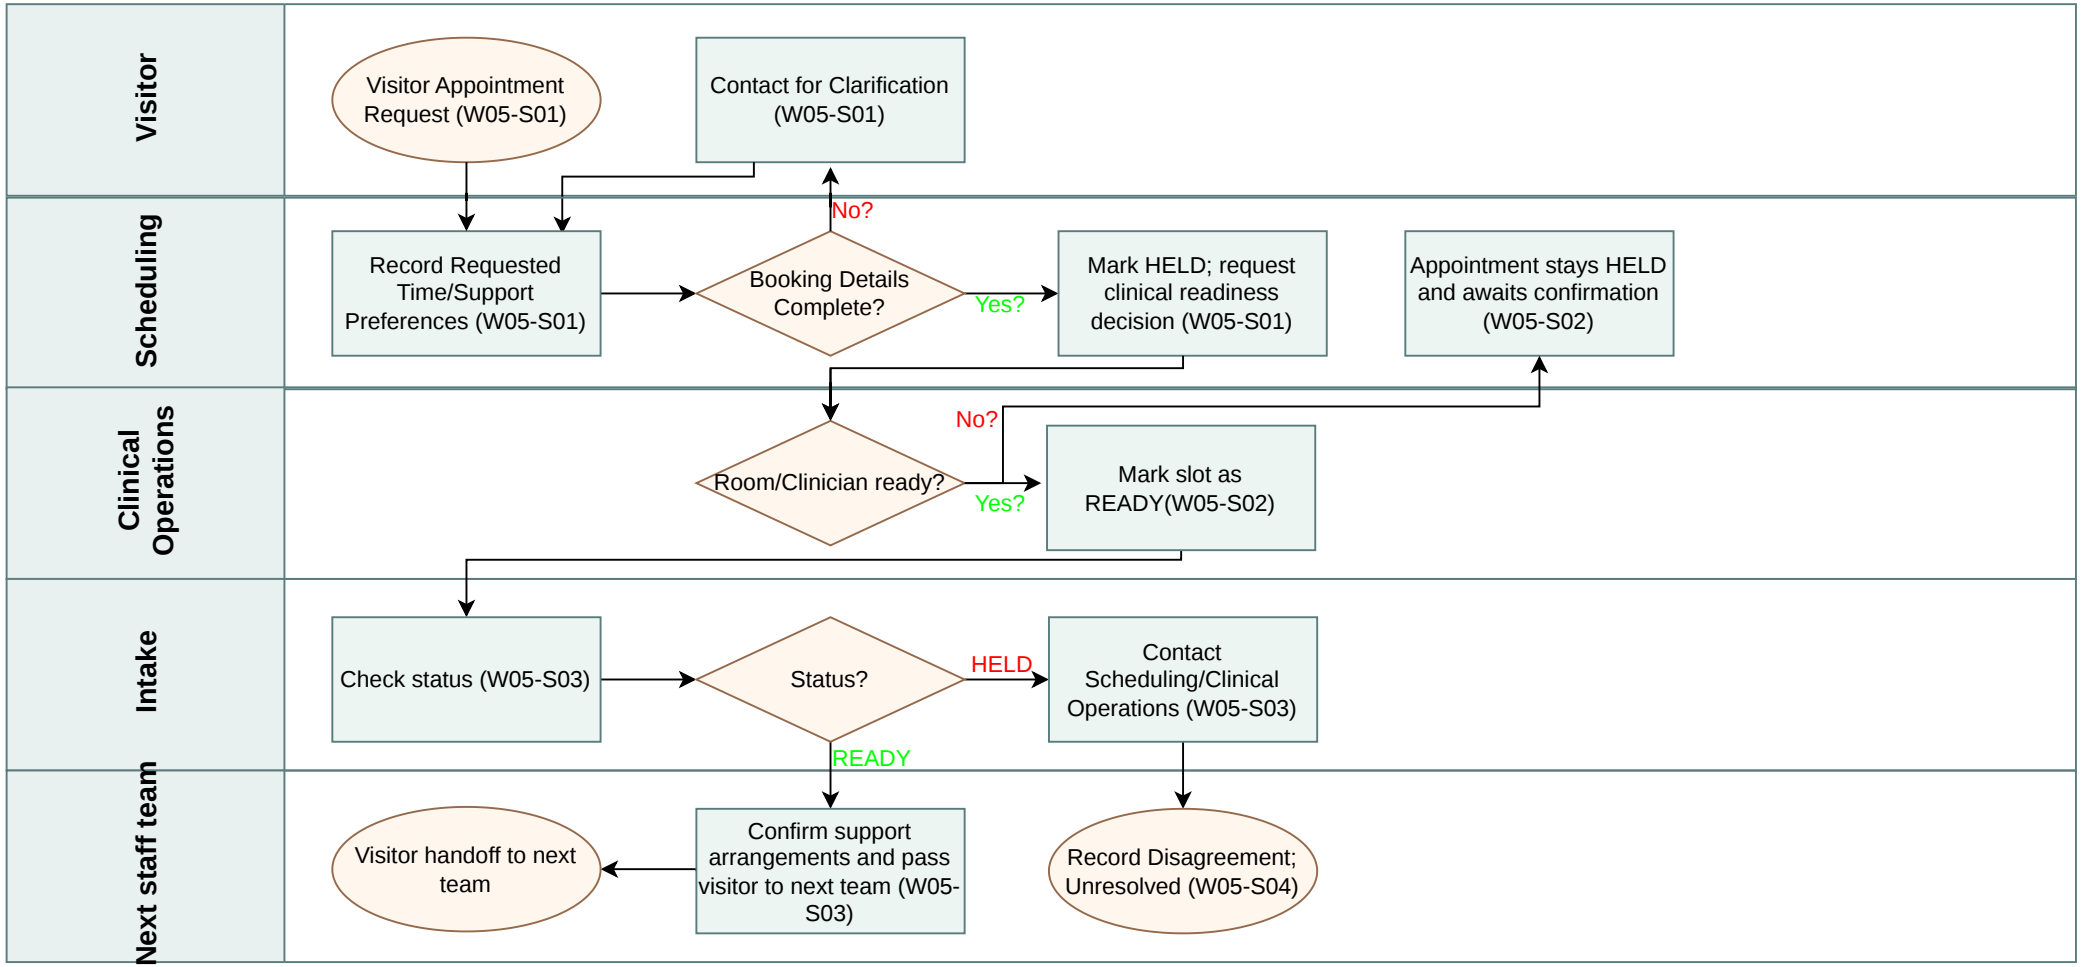
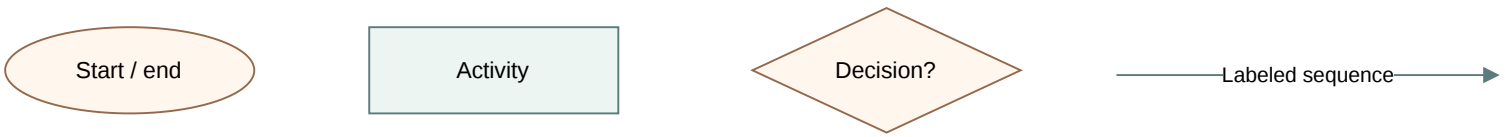
CIT 140 · Week 5 | Current Appointment Process

Diagram tracks the visitation process from start to end using supported evidence from all sources.



Symbol key (copy these shapes into your lanes; they are not case steps)



Week 5 | Scope and Findings

1 · Process scope
Luis Barajas. The purpose of this process is to recount how different departments interact to cater to the visitor. The visitor must request an appointment and be subsequent passed onto another team as the end result. The visitor, scheduling, clinical operations, and intake must all work together. The diagram does not include what occurs when the visitor's request is unresolved.

2 · Check the two paths
The visitor submits an appointment request and it is then processed by scheduling. Scheduling calls the visitor back asking for details if necessary. Scheduling then submits a clinical readiness decision to Clinical Operations, who check if both a room and specialized clinician are available. If they are not, the visitor is placed on hold until they are. If they are, the visitor is marked as READY and intake checks their status.

3 · Evidence and model review
I made one correction in the visitor section, where I realized that the visitor would check in with scheduling again once their info was confirmed, so I edited the model to show that. We still have no way of completely eliminating the possibility of a record disagreement occurring in the system.

4 · Learning reflection (reuse your Discord paragraph)
The model made the visitation process much more clear for me; I find that visual information is much easier for me to absorb. The responsibilities of specific individuals and how they will check their information remains unclear. I find that process modeling over what felt like monotonous writing (no offense) in Week 4 was much more digestible and actually provided me more insight.

5 · Portfolio evidence
Barajas_Luis_CIT140_Week05_As_Is_Process_Model.drawio and Week05_Discord_Post.
